Harvest Gold Corp.

February 18, 2019

**20 g/t Gold Discovered and Now
Drilling Deeper for a Possible
Boiling Zone**

-
- **Initial drill results released from the Harvest-Evrim JV at Cerro Cascaron in Mexico**
 - **20 g/t gold and 22 g/t silver over 1 meter at Serpiente Dorada**
 - **A possible boiling zone below holes at San Pedro – now testing theory**
 - **HVG in Canada, HVGDF in the US**
 - **Share price at \$.025 – sell the news impacts share price**

Summary

The much anticipated initial drill results from the Harvest Gold – Evrim JV Cerro Cascaron project in Mexico were released this past week. Highlights include:

San Pedro

SPED19-02 intersected 4.8 meters grading 1.02 g/t gold and 13.0 g/t silver from 141 meters down-hole and 0.35 meters grading 5.39 g/t gold and 23.7 g/t silver from 154.45 meters down-hole.

SPED19-03 intersected a 2.7-meter-wide quartz vein from 162.6 meters down-hole. Assays are pending.

Serpiente Dorada

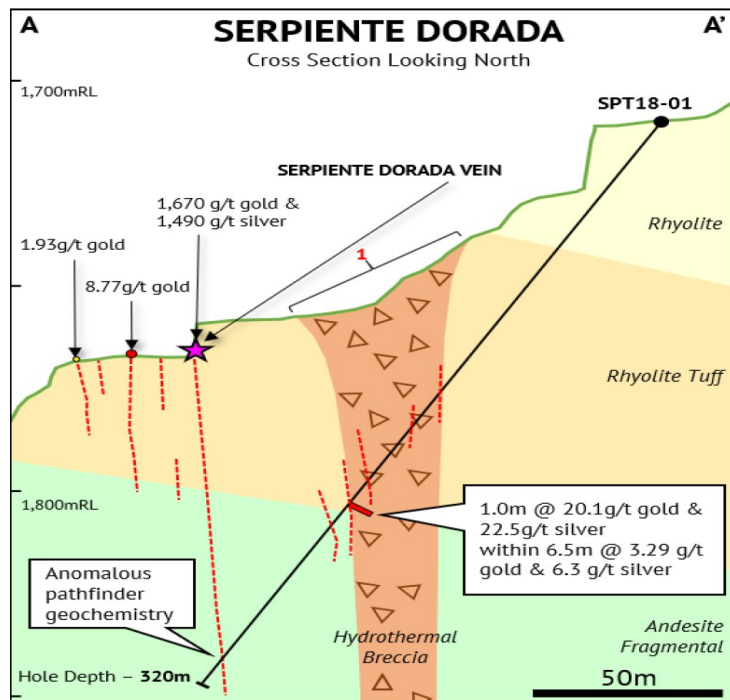

Drill hole SPT18-01 intersected 1.0 meter grading 20.1 grams per tonne (g/t) gold and 22.5 g/t silver from 225.5 meters within 6.5 meters grading 3.29 g/t gold and 6.3 g/t silver from 224.5 meters.

As often happens in this current bear market for the junior exploration companies the stock immediately sold off on the news to multi-year lows – currently sitting at \$.025. One seller through National Bank sold 4.6 million shares which led to the down draft.

Was the negative reaction in the share price deserved? The identification of 20 g/t gold approximately 100 meters below the high grade surface samples shows that a gold system does indeed exist at depth.

A follow-up drill hole has been designed to target this zone of mineralization approximately 180 meters to the north where the northeast-trending La Julieta vein is interpreted to intersect the Serpiente Dorada structure.

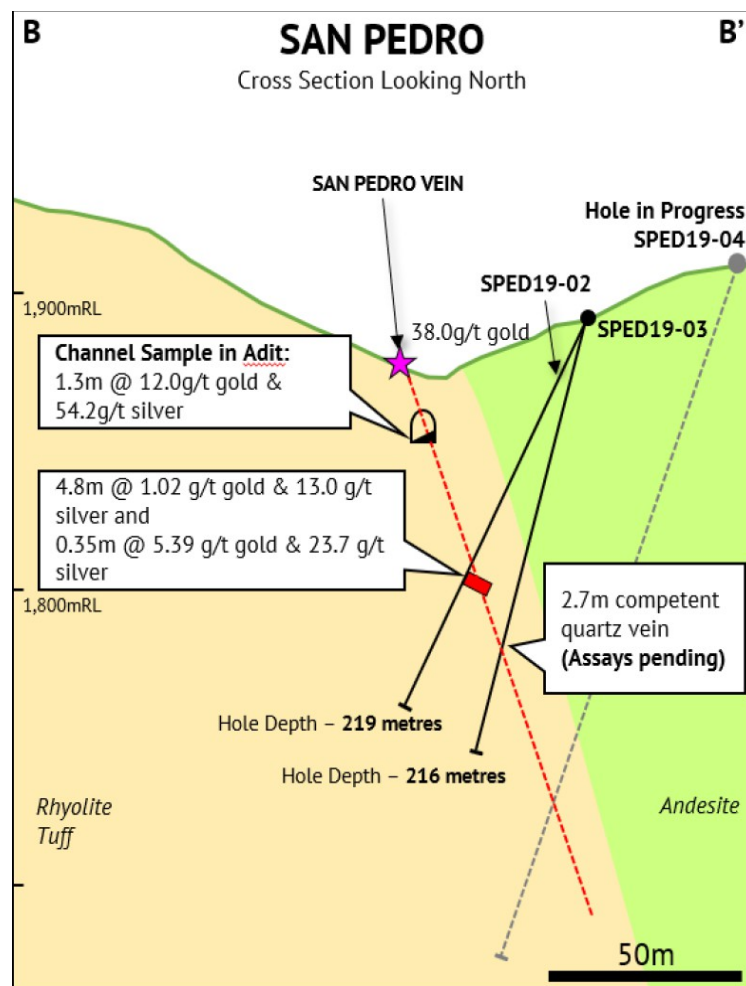

At the San Pedro target, two gold zones were hit. As detailed in the press release:

Drilling at San Pedro has intersected a quartz vein beneath the shallow historic workings hosted in rhyolitic tuff and andesite. Drill hole SPED19-02 intersected a 1.8 metre wide quartz vein within an approximate 20 metre stockwork zone. The zone includes 4.8 metres grading 1.05 g/t gold and 15.8 g/t silver from 141 metres downhole with a slightly deeper narrow vein returning 0.35 metres grading 5.39 g/t gold and 23.7 g/t silver from 154.45 metres downhole. The true width of the structures are not known at this stage. Follow-up drill hole SPED19-03, intersected a 2.7 metre wide vein from 162.6 metres within a broader 33.5 metre surrounding stockwork zone. Assays results remain pending for drill hole SPED19-03.

The vein intersected in holes SPED19-02 and SPED19-03 contains banded chalcedonic quartz and calcite with quartz-healed breccia channels indicative of multiple phases of vein formation. The textures suggest a level near to, but above a boiling zone (where the best mineralization is to be expected) and subsequently, a fourth hole at San Pedro is planned to target a potential mineralized shoot with better mineralization approximately 100 metres deeper than hole SPED19-03.

Again as with the Serpiente Dorada target, the drilling at San Pedro has shown that the gold sampled on surface carry to depth. As can be seen on the drill map at the right hole # SPED 19-04 is currently in progress to test the theory that a boiling zone with higher grade gold may lie below holes SPED 19-02 and 19-03.

Harvest Gold CEO, Rick Mark, stated: "The maiden drill program at Cerro Cascaron successfully intersected gold mineralization at both the San Pedro and Serpiente Dorada areas. We are particularly excited about the immediate prospects for the San Pedro target and have committed an additional \$30,000USD to repurpose our last drill hole to go deeper at San Pedro."

Upcoming Catalysts

Investors should be watching Harvest Gold for the next set of results which will include:

At San Pedro, assays for hole SPED 19-03 which intersected a 2.7-meter-wide quartz vein from 162.6 meters down-hole.

Also at San Pedro, approximately 100 meters deeper than the SPED 19-03 hole, assay results for SPED 19-04 testing for a possible boiling zone.

At Serpiente Dorada, assays for a hole designed to target to target a zone of mineralization approximately 180 metres to the north where the northeast-trending La Julieta vein is interpreted to intersect the Serpiente Dorada structure.
