## Libero Copper

May 27, 2019

### The Big Red Project – High Grade Gold in Soils Bigger Than GT Gold

**LIBERO**  
COPPER

- One of the strongest geological teams in the sector; ex Lumina Copper
- New Big Red project has some of the highest gold in soils in the GT
- Shares trading at \$.10 CAD with a \$6 million market cap, bottom of range
- \$2 million CAD private placement in process to fund drilling
- LBC in Canada, LBCMF in the US
- See initial report at: <http://statesidereport.com/wp-content/uploads/2019/04/Libero-Copper-The-Lumina-Copper-Model-with-the-Architect-that-Achieved-a-50-Bagger.pdf>

## Summary

Today Libero announced significant gold in soils at the Ridge target of their Big Red Project in the Golden Triangle of British Columbia, Canada. The last time I saw these types of gold grades in soils in the Golden Triangle was GT Gold's Tatogga project. In December 2016 I issued a report on GT Gold when it was trading at \$.21/share and said it was a stock every junior resource investor needed to own for 2017 (see the report here:

<http://statesidereport.com/wp-content/uploads/2019/05/GT-Gold-The-One-Stock-Every-Jr-Investor-Needs-to-Own-for-2017.pdf>). Those that owned the stock at \$.21 achieved 10 bagger status as it ran to over \$2.50 that summer as they discovered high grade gold at depth below the gold in soils.

Today famed geologist and EVP of Exploration Leo Hathaway stated: “We are very excited with the initial results from this compilation work and especially the Ridge target”. “Although comprising more widely spaced samples, the soil anomaly at Ridge is remarkably similar to that explored by GT Gold where epithermal gold and porphyry copper-gold deposits were discovered by subsequent drilling at Saddle South and Saddle North respectively”.

The high grade gold soil anomaly at Ridge is bigger than GT Gold's Saddle deposit as it measures 3 km east to west and 2 km north to south. See below for Libero's gold anomaly at the same >0.5 g/t gold in soils compared to GT Gold's Saddle deposit – Ridge is much larger.

**LIBERO**  
COPPER

BIG RED

Typically 0.5 g/t gold in soils is considered very high grade in gold exploration. As can be seen at the Ridge Target gold in soils include 25 g/t gold, 14 g/t gold, 13 g/t gold, 12 g/t gold and several others over 1 g/t gold. These results are exceptional and EVP Leo Hathaway is just the right person to find the high grade gold at depth.

The plan is to get boots on the ground to infill more of the high grade gold in soils and then follow-up with a drill program this field season. The press release is below:

**LIBERO COPPER ANNOUNCES ADDITIONAL GOLD-COPPER TARGET ON THE BIG RED PORPHYRY PROPERTY IN THE GOLDEN TRIANGLE**

*May 27, 2019 – Libero Copper Corporation (TSX-V: LBC, OTCQB: LBCMF) is pleased to announce the completion of a large compilation of historical data for the Big Red porphyry gold-copper property in the Golden Triangle in British Columbia, Canada.*

*Location, description, and assay data for 1,714 rock chip and 1,957 soil samples were digitized from 35 assessment reports for the area dating back to 1963. As a result of this work, Libero Copper has added to the existing 17,538 hectare claim block with 3,041 hectares of new claims, bringing the total to 20,579 hectares.*

*The compilation provided a geochemical coverage of the property never attained by previous operators. Of particular note is the new Ridge target located to the south of the primary porphyry target, where a coincident gold and copper soil anomaly extends three kilometres from east to west and two kilometers north to south at a 300 ppb gold and 300 ppm copper threshold and is open to both the east and west. Within this zone individual soil samples range as high as 25 grams per tonne gold and historical rock chip samples grade up to 29 grams per tonne gold.*

*Descriptions of outcrop in this area include a quartz-feldspar porphyry intrusion with disseminated pyrite and pyrrhotite and quartz-sulphide stockworks and veins. Libero plans to complete infill soil sampling lines and geological mapping at the Ridge target early in the current field season in order to confirm drill targets.*

*“We are very excited with the initial results from this compilation work and especially the Ridge target”, commented Leo Hathaway, EVP Exploration. “Although comprising more widely spaced samples, the soil anomaly at Ridge is remarkably similar to that explored by GT Gold where epithermal gold and porphyry copper-gold deposits were discovered by subsequent drilling at Saddle South and Saddle North respectively”.*

*The compilation work of historic samples has identified numerous additional targets warranting further work including the Poker target where rock chip samples from 36 large angular quartz vein boulders up to two metres in diameter have returned grades up to 252 grams per tonne gold and 35 grams per tonne silver shed from a glacial valley that lies entirely within the claim block. Rock chip samples from boulders are not necessarily representative of the hosted mineralization.*

*The presented data is derived from assessment reports filed in the BC Ministry of Energy and Mines Assessment Report Indexing System, which can be found at <http://aris.empr.gov.bc.ca/>. Sample locations were digitized in a Geographic Information System and geochemical results hand entered and then rechecked. The QP concluded that the resulting database is of reasonable quality for interpretation. While the accuracy and precision of historical assays cannot be verified, the QP is satisfied that historical lab results were reasonably accurate and precise for the time when the samples were processed.*

### ***About the Big Red Porphyry Gold-Copper Property***

***Big Red comprises 15 contiguous claims totalling 20,579 hectares in northwestern British Columbia, 45 kilometres southwest of Telegraph Creek. Big Red lies within the Golden Triangle 70 kilometres north of Galore Creek and 80 kilometres west of GT Gold's Saddle discovery. Big Red is located 18 kilometres from paved highway with dirt roads extending to the claim block. This is the first time that the entire project has been consolidated under one operator.***

***The Golden Triangle is a geological province of prodigious copper and gold mineralisation and host to some of Canada's most famous mines, including Premier, Red Chris, Snip, Brucejack and Eskay Creek. Within the Golden Triangle porphyry copper and gold, epithermal gold and silver and volcanogenic massive sulfide styles of mineralisation have all been recognised. At Big Red all three of these styles exist, indicating that a large mineralised system has been preserved from erosion. The primary porphyry copper target is centred on a distinct magnetic-high feature that coincides with a radiometric potassium anomaly, copper, gold and molybdenum anomalies and a mapped Jurassic aged porphyry intrusion. The new Ridge gold-copper target lies to the south and the Poker gold target lies to the west of the porphyry centre. The technical information contained in this news release has been reviewed and approved by Libero Copper's Executive Vice President of Exploration, Leo Hathaway P.Ge., who is a Qualified Person as defined under NI 43-101***
