New Compelling Copper-Gold Targets Defined at Miner Mountain

- A “fresh look” at Miner Mountain has generated several new drill targets
- Expanded geologic team with the addition of Charles Funk
- Previous drilling: DDH 12-21: 100 meters grading 0.95% copper and 0.55 g/t gold from 10 meters
- Commodities (including copper and gold) now at 100 year lows vs financial assets
- Market cap - \$4 million

The Miner Mountain Project

The Miner Mountain Copper-Gold Project is located in the Quesnel Stikine Terrane, which currently contains three copper gold porphyry projects approaching production.

Located immediately east of the town of Princeton, and 15 kms north of Copper Mountain the project has immediate access to highways, hydro power, full communication, and is accessible year round.

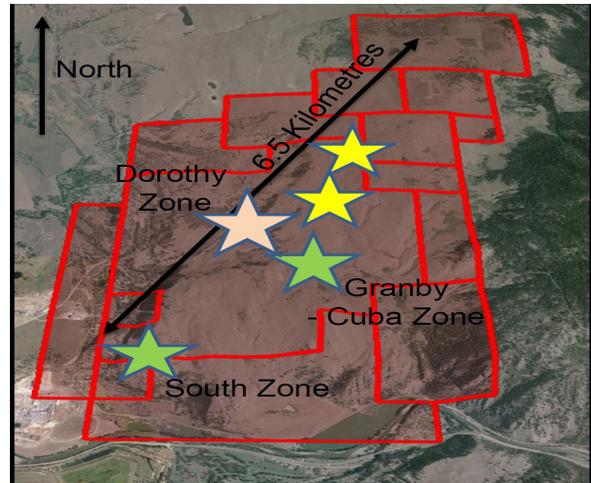

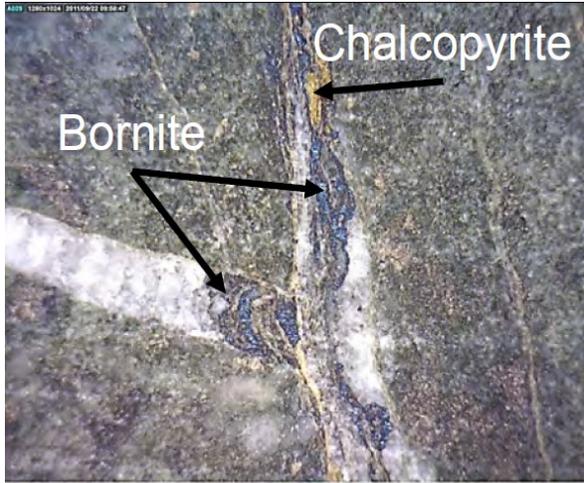

Updates

The junior exploration sector has been out of favor for the past several years as financial assets have increased in value due in part to central banks around the world dropping interest rates to all-time lows, including over \$17 trillion in negative interest rate debt. This in turn has led to commodity prices as a whole (including copper and gold) falling to 100 year lows vs the value of financial assets. History has shown us that in other periods of time where commodities were extremely undervalued relative to paper assets (1929, 1969 and 1999 – see a pattern?) it was the opportune time to be invested in this beaten down sector as financial assets had peaked and commodities were just about ready to explode higher.

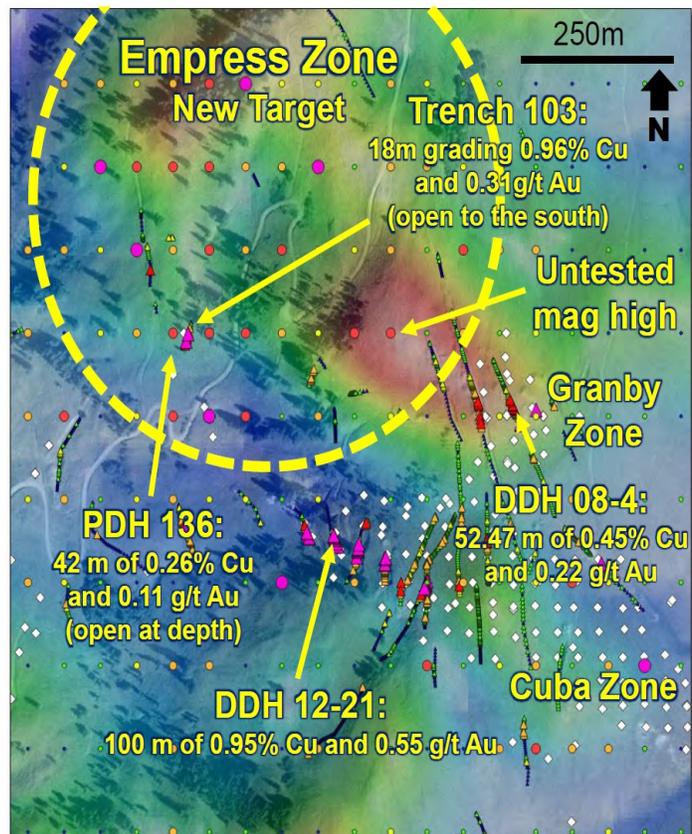

I introduced readers to Sego Resources previously (see <http://statesidereport.com/wp-content/uploads/2019/01/Sego-Resources-Vectoring-in-on-Canadas-Next-Copper-Gold-Porphyry-Discovery-November-2018.pdf>). Over the last several months Sego Resources has been analyzing all previous exploration data from Miner Mountain. With the help of Charles Funk, newly appointed exploration advisor, Sego has identified several new compelling drill targets at Miner Mountain.

Charles Funk has extensive experience in copper-gold porphyry systems having worked as vice-president of new opportunities and exploration at Evrim Resources as well as with Newcrest Mining and Oxiana/Oz Minerals. He is currently the vice-president of exploration of Vizsla Resources.

In recent years Sego has explored primarily in and around their Granby-Cuba zone of the Miner Mountain project. The Granby-Cuba Zone is upslope from a 500,000 tonne copper-gold mineralized slide block. Drilling at the Granby-Cuba Zone has identified an extensive (1,400 m x 220 m) zone of copper-gold mineralization, with grades up to 0.95% Cu and 0.55 g/t Au over 100 meters (DDH 21) beginning 10 meters from surface. However, the porphyry source of this near surface copper/gold material has not yet been located. That may be about to change.

Just this past week the company announced the results of a recent “fresh look” at Miner Mountain and have identified several new compelling drill targets. The first and primary new target is the Empress Zone, northwest of the Granby-Cuba zone. As stated in the press release....*The Empress Zone is an approximately 500 meter by 600 meter copper and gold soil anomaly with elevated molybdenum, silver, zinc, manganese and iron. This signature is typical of alkalic porphyries in southern British Columbia. Further the zone has a complex magnetic signature with a central magnetic low, two bullseye magnetic highs (2) and occurs on the margin of a chargeability high. The relationship of magnetite alteration with copper mineralization at Granby makes the proximal magnetic high an attractive target.*

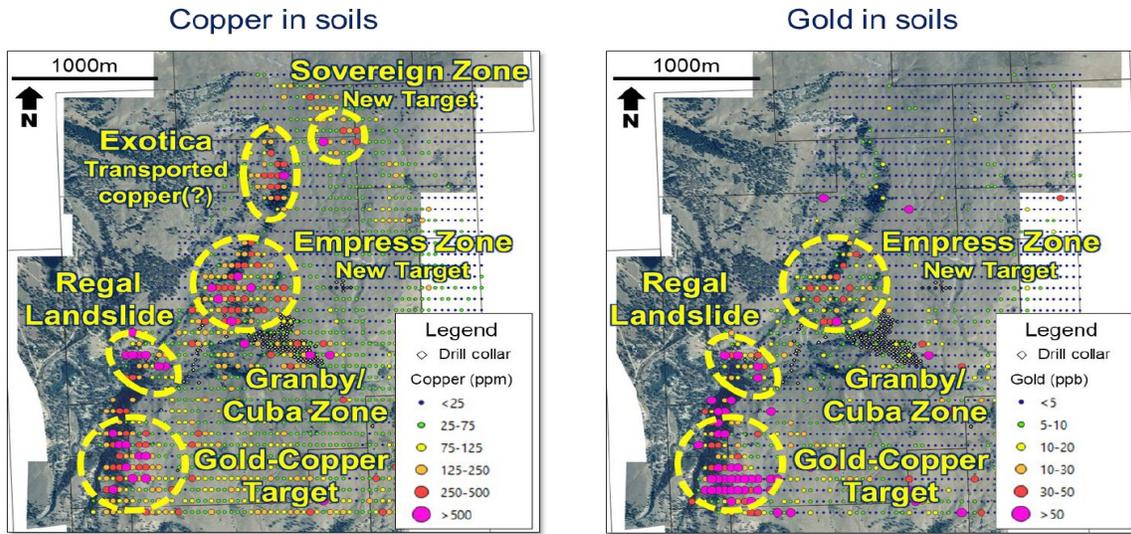

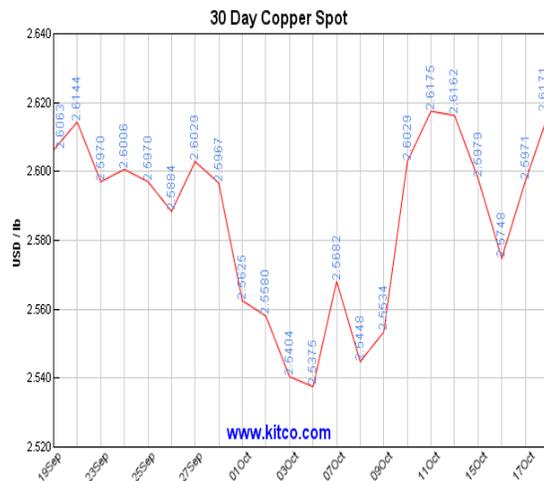

Figure 1: Copper and Gold in soils with Miner Mountain exploration targets labelled.

In addition to the Empress Zone other new targets include the Gold-Copper target to the south of the Granby-Cuba Zone as well as targets to the north including the Exotica and Sovereign Zones. Both of these have seen little to no prior exploration.

Next Steps

Sego is looking at a two-phase project plan over the next few months. The first phase would involve shallow RC drilling down below the till cover (5-15 meters) and then continue the hole when in copper-gold mineralization. Planned drilling would be in the area of 500-750 meters at a cost of approximately \$515,000. As a follow-up to the phase one program, a phase two program would start in January 2020 that would include 2,000 meters of diamond drilling at Empress, the Gold-Copper Zone and at the Sovereign target at an estimated cost of \$635,000.

More information can be found on Sego's website at <https://www.segoresources.com/> and a new, updated presentation can be viewed at <https://www.segoresources.com/wp-content/uploads/2019/10/Sego-Resources-Presentation-October-2019.pdf> .
