Harvest Gold Corp.

March 29, 2022

**Currently Drilling the Emerson Project –
Promising Visuals – Assays Pending**

- **Market cap of \$7 million at \$.18/share CAD**
- **Harvest Gold – HVG on the TSX-V, HVGDF in the US**
- **Currently drilling the Emerson project in BC, Canada**
- **Drill hole core confirms source of large IP anomaly**
- **Alteration and mineralization extend below limits of geophysical information**
- **Large footprint and continuity of pyrite mineralization to depth**
- **Two holes completed – assays pending**
- **President Rick Mark: info@HarvestGoldCorp.com**

Summary

Earlier this month Harvest Gold management updated the market on their maiden drill program at their Emerson project in British Columbia. For a summary of this project see my December 2021 report at <http://statesidereport.com/wp-content/uploads/2021/12/Harvest-Gold-Drilling-and-Marketing-Begin-January-2022.pdf>.

Both gold and copper prices have remained buoyant over the past year and money has started flowing back into the juniors.

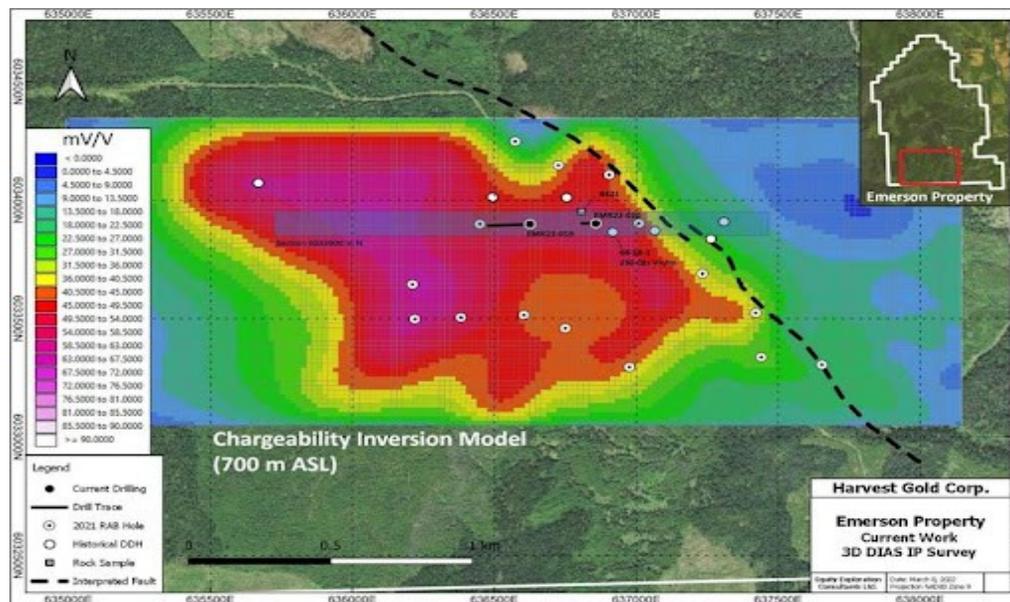

Since my December report was issued Harvest's share price is up 66% as the drills are now turning.

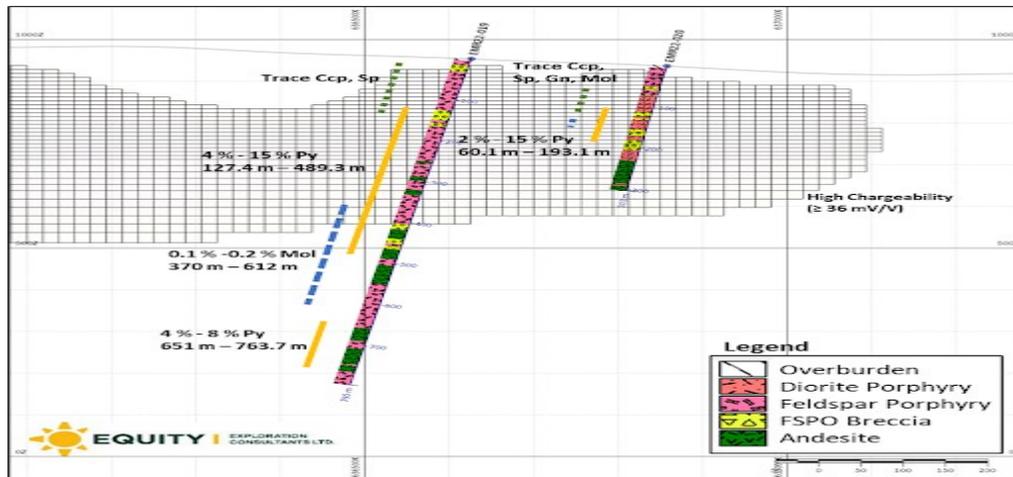

Two holes out of the current five hole, 2,600 meter diamond drill program were completed as of the most recent update.

A few key highlights taken from this recent update include:

- **Drill hole core confirms source of large IP anomaly:** The first two drill holes have shown that chargeability anomalies in the DIAS 3D IP inversion results are related to significant hydrothermal pyrite in quartz pyrite-breccia zones and quartz pyrite stockworks in feldspar porphyry and andesite, with apparent thicknesses of up to 50 meters and up to 600 meters, respectively.

- **Alteration and mineralization extend below limits of geophysical information:** Quartz-pyrite stockwork zones extend to depths of 795 meters, more than 300 meters below the limits of the 3D IP chargeability inversion. This coincides well with a ~165 ha chargeability anomaly open to the NW.
- **Large footprint and continuity of pyrite mineralization to depth:** Alteration intersected includes clay within vuggy feldspar porphyry from surface to 150 meters depth. Below this, pervasive and stockwork silicification and clay alteration from 290 to 795 meters depth. Mineralization to 795 meters depth includes pyrite dissemination, quartz-pyrite ± molybdenite veins, pyrite veinlets, and galena-sphalerite veins.

- ***Two holes completed;*** Two diamond drill holes totaling 1,098 meters have been completed to date. Drill hole EM22-019 was completed to a hole depth of 795 meters, while drill hole EM22-020 (collared 235 meters east of EM22-019) reached a depth of 303 meters along the same section. EM22-020 was terminated before proposed depth due to ground conditions. Core samples are being dispatched from the Company’s core logging facility in Houston, B.C. to ALS Global preparation facilities in Kamloops, B.C. Assays results are pending.

EMR22-019 at 130.5 to 134.5 m A) Quartz cemented breccia; dark gray-black veinlets are made up of quartz and 30 – 40 % very fine-grained pyrite. B) Close-up photograph showing later phase of brecciation from dark quartz-pyrite veinlets.

A) EMR22-020 at 162 m: Brecciation of silicified feldspar porphyry with quartz-pyrite cement. B) EMR22-020 at 168 m: Cluster of pyrite-quartz veinlets cutting clasts and cement of breccia, note sulfides up to 15%.

Obviously assays are needed to determine the grade of gold/copper in the first two holes but the program is off to a good start with promising visuals. As Henry Awmack, a member of Harvest Gold's Technical Advisory Board and property co-vendor stated.....

“Initial diamond drill testing at our Emerson Project confirms that a very large (2000 meters X 900 meters), open, IP chargeability anomaly can be attributed to quartz-pyrite breccia zones overlying thick quartz-pyrite stockwork zones. Breccia zones are hosted in clay-altered and silicified feldspar porphyry and host 2-15% pyrite. Apparent thickness of the breccia zones reaches 50 meters. Silicified feldspar porphyry with a quartz-pyrite stockwork extends to the bottom of the initial hole EMR22-019 at 795 meter hole depth, showing the great depth extent of the system. We are very encouraged by the visual core results and look forward to providing further updates when we receive analytical results.”

The current drill program is going according to plan and on budget and an update will be provided shortly.
