Currently Drilling – Strong Visuals Assays Pending

Historical Resource - 160 Million Silver Eq Oz.

SILVER DOLLAR
RESOURCES

- Silver Dollar Resources – SLV on CSE, SLVDF in the U.S
- Share price at \$.55 – Attractively priced for significant upside
- \$9 million in the treasury, No warrants outstanding
- Eric Sprott and First Majestic own 37% of the 41.9 million shares out
- Currently drilling – Assays pending on strong visuals

The News Keeps Getting Better

In early April the company announced they had begun phase 2 exploration drilling at the Noria portion of their La Joya Silver Project located in the state of Durango, Mexico. Phase I drilling began in November 2021 with 11 holes totaling 2,424 meters drilled producing exceptional results. In March, seven holes were reported with two of the holes showing:

- **NOR-21-002** that returned 131.2 g/t silver eq. over 5.37 meters
- **NOR-21-004** that returned 1,590 g/t silver eq. over 3.00 meters, and 2,369 g/t silver eq. over 1.01 m within a broader intersection of 361.8 g/t silver eq. over 8.37 meters.

Hole 4 was drilled in the hopes of intersecting deep, high-grade “San Martin” style silver mineralization that had been discovered in the 90's but the hole deviated off course. Fortuitously, the drill intersected unexpected high-grade gold in multiple intervals including 19.2 g/t gold over 3.00 meters starting from a depth of 126 meters downhole and 29.0 g/t gold over 1.01 meters starting from a depth of 164.61 meters downhole. This shallow gold zone will be a primary target going forward in the phase 2 program.

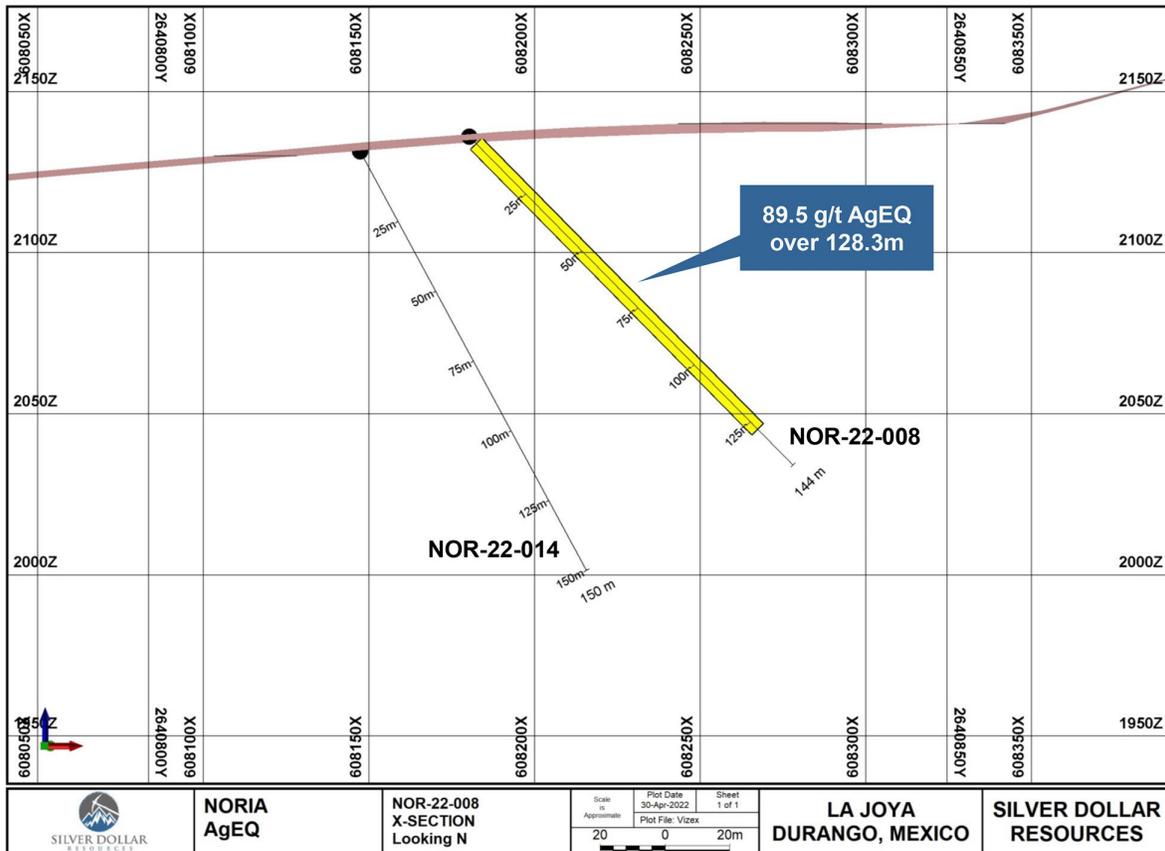

Then earlier this month in May the company reported the remaining four holes from phase 1 with two of the holes showing:

- **NOR-22-008 intersected 89.57 g/t silver eq. over 125.3 meters starting at 3 meters downhole. This interval includes 267.56 g/t silver eq. over 10.47meters starting at 70.53 meters downhole. Mineralization consists of silver, gold, copper, lead and zinc mineralization over wide intervals associated with sulphide veins, hornfels, and quartz veins hosted in Indidura formation carbonates adjacent to a monzonite intrusive. (that's a mouthful)**

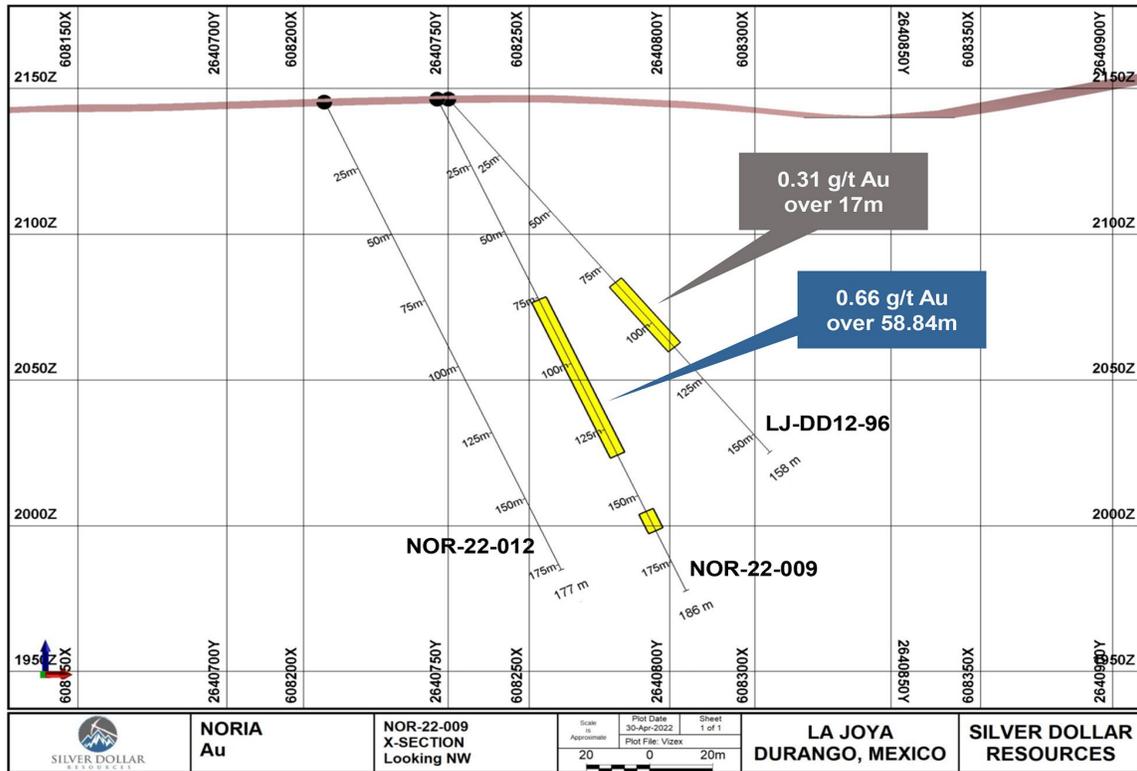

Importantly, hole 8 was drilled 1 kilometer west of the main mineralized trend and is an exciting new discovery.

Hole 14 in the current phase 2 drill program will continue to chase the mineralization found in hole 8.

- **NOR-22-009 intersected 60.33 g/t silver eq. over 58.84 meters starting at 75.83 meters downhole. This hole was higher grade in gold recording 0.66 g/t gold over the same 58.84m interval. Gold tenors were over twice the grade and triple the width of mineralization encountered in a historical hole in the 90's.**

Hole 9 is equally important as it was designed to test the downward extension of the mineralization previously encountered in a historical hole from the 90's with an intercept of 0.32 g/t gold over 29 meters. This hole returned 0.66 g/t gold over 58.84 meters starting at 75.83 meters downhole, both increasing previous gold tenors and width encountered in the historical hole. This intercept also averaged 60.33 g/t silver eq.

Hole 12 in the current phase 2 drill program will continue to chase this increasing width of mineralization found in hole 9.

Assays are pending from the early holes of the current drill program but as President and CEO Michael Romanik stated in the May 4th press release;

"Phase II drilling continues, and we have encountered similar sulphide mineralization over even broader widths and will expand the program as analytical results dictate."

It looks like we have a lot to look forward to in the coming weeks!
